PLANT SPECIES OF SPECIAL CONCERN

April 1993

The Montana Natural Heritage Program (MTNHP) is conducting an inventory of the elements of biological diversity in Montana. The inventory includes plant species, animal species, and plant communities that are rare, endemic, disjunct, threatened, or endangered throughout their range or in Montana, vulnerable to extirpation from Montana, or in need of further research.

The attached list of 379 plant taxa of special concern in Montana summarizes the current status of these plants. It has been developed from numerous sources including published and unpublished scientific literature, herbarium specimens, the Montana Rare Plant Project files (University of Montana), knowledgeable people, and field research. This list is dynamic and is revised periodically as new data become available. Changes to the list since the most recent edition (Achuff 1991) are highlighted for quick reference. The publication "Sensitive, threatened and endangered vascular plants of Montana" (Lesica and Shelly 1991) provides distribution and habitat information on most of the species. Other references include the Montana Sensitive Plant Field Guide (USDA Forest Service 1988), Dorn (1984), and other floras.

Comments and suggestions are needed concerning this list, particularly regarding additions or deletions. New locational information for any of these taxa is also being solicited. The MTNHP can supply current locational information and status data for most of these taxa.

Additions to the 1993 list reflect either additions to the state flora, an intent to maintain information at some level for all state endemics and species of "C2" status under the Endangered Species Act, and reconsideration of data for taxa which had previously been in the "unknown" category. Many variety names have been added to species on the list, most of which are the only varieties present and key out in Dorn (1984). They represent efforts to standardize nomenclature among states.

Taxa are evaluated and ranked on the basis of their global (range-wide) status, and their state-wide status. A scale of 1 (critically imperiled) to 5 (demonstrably secure) is used for these ranks, and each species is assigned the appropriate combination of global and state ranks.

Example: Adoxa moschatellina = G5 / S1. (Species is demonstrably secure globally; in Montana is critically imperiled because of extreme rarity (≤ 5 occurrences).

Global and state ranks are assigned according to a standardized procedure used by all Natural Heritage Programs, defined below.

<u>Global/State Rank</u>		<u>Definition (G = Rangewide; S = Montana)</u>
G1	S1	Critically imperiled because of extreme rarity (5 or fewer occurrences, or very few remaining individuals), or because of some factor of its biology making it especially vulnerable to extinction.
G2	S2	Imperiled because of rarity (6 to 20 occurrences), or because of other factors demonstrably making it very vulnerable to extinction.
G3	S3	Either very rare and local, or found locally (even abundantly at some of its locations) in a restricted range, or vulnerable to extinction throughout its range because of other factors; in the range of 21 to 100 occurrences.
G4	S4	Apparently secure, though it may be quite rare in parts of its range, especially at the periphery.
G5	S5	Demonstrably secure, though it may be quite rare in parts of its range, especially at the periphery.
GU	SU	Possibly in peril, but status uncertain; more information needed. This is the rank assigned all species on the list of plants of undetermined status and a small number of plants being tracked under select circumstances.
GH	SH	Historically known only from records before 1940; may be rediscovered.
GX	SX	Believed to be extinct; known only from records at sites where systematic relocation efforts have been unsuccessful. Note: There are no Montana plant species assigned the GX or SX rank at present.

Other codes:

- Q Taxonomic questions or problems involved, more information needed; appended to the global rank.
- T Rank for a subspecific taxon (subspecies or variety); appended to the global rank for the full species.

It should be emphasized that global and state ranks are periodically reviewed. Any updates will appear on future lists.

USF&WS Status: The symbols in this column denote the categories defined in the U.S. Fish and Wildlife Service Notices of Review (1980, 1983, 1985, 1990) and indicate the status of a taxon under the federal Endangered Species Act of 1973. Note that publication of the U.S. Fish and Wildlife Service Notice of Review is imminent in 1993 as this list goes to press, and list users are advised to check with the U.S. Fish and Wildlife Service - Area Office in Helena. Categories include:

- E Endangered (none in Montana).
- T Threatened (none in Montana).
- P Proposed E or T (none in Montana).
- C1 Notice of Review, Category 1 (substantial information on biological vulnerability to support proposals to list as endangered or threatened; **one in Montana**).
- C2 Notice of Review, Category 2 (some evidence of vulnerability but not enough data to support listing at this time; **18 in Montana**).
- C2* Category 2 taxon that is possibly extinct (none in Montana).
- 3A Taxa for which the USFWS has persuasive evidence of extinction (none in Montana).
- 3B Names that, on the basis of current taxonomic understanding, do not represent taxa meeting the Endangered Species Act's definition of "species."
- 3C Taxa that have proven to be more abundant or widespread than was previously believed, and/or those that are not subject to any identifiable threat (**19 in Montana**).

USFS Status: The categories in this column are defined by Region 1 of the U.S. Forest Service as most recently set in 1991. Note that the U.S. Forest Service Region 1 sensitive species list is undergoing review as state list goes to press. List users are advised to check with the Region 1 Office of the U.S. Forest Service in Missoula. List categories include:

SENSITIVE: a plant species, subspecies or variety, for which the Regional Forester has determined there is a concern for population viability within a state, as evidenced by a significant current or predicted downward trend in populations or habitat. All sensitive plants are known to occur on national forest land. This category may include federal candidates (C1, C2, 3C) or plants proposed for listing as threatened or endangered in the Federal Register.

WATCH: a plant species, subspecies or variety that is not known to occur on national forest land but is predicted to occur there on the basis of suitable habitat, and for which there is concern for population viability within a state as evidenced by a significant current or predicted downward trend in populations or habitat. These taxa, if found on national forest land, would be designated as sensitive. This group may include federal candidates (C1, C2, 3C).

BLM status - The State Office of the Bureau of Land Management is in the process of developing a sensitive species list and policy. List users are advised to check with the State Office in Billings.

Other taxa on which information files are maintained:

At the end of this list are plants of undetermined status. They are not tracked in the primary databases, but information is being compiled on them to resolve status questions for consideration in future list updates.

UNDETERMINED: Taxa for which there is a question as to identity, taxonomic status, or adventive nature are included in this category. Also included here are plants reported to be in Montana but for which we have no verifiable evidence of their occurrence here.
